

Automate Tasks and Take Charge of AP Processing

Benefits

- Save time by adding workflows to any type of report
- Affordable and easy to use
- Seamless integration with Sage CRE

TimberScan Commander allows any Crystal report to be modified to include workflow commands. Commander offers additional power by adding workflows to documents such as purchase orders, contracts, leases, and accounts receivable invoices by embedding 'invisible' instructions. When you're ready to export your Sage 300 CRE reports, or reports from other software packages, use the Print function and Commander will execute tasks for your specific documents.

Many construction and real estate AP professionals use TimberScan Commander to have a batch of change orders or paystubs automatically emailed to specific vendors, workers, or employees with matching subject lines. The attachments can flow seamlessly into TimberScan® as fully coded, searchable, and viewable supporting documents that can also be stored in

Sage 300 CRE as an attachment on single or multiple records.

Commander can enable immediate document indexing to TimberScan, too, with the added bonus of reducing manual data entry burdens. Set up is simple — please refer to the Technical Requirements for TimberScan. Affordable and easy to use, Commander delivers a quick return on investment!
