

Core Cloud Systems - CCS Service Work Order Solution

Integration with TimberScan and Other Systems

The Core Cloud Systems (CCS) Service Work Order solution simplifies the order, billing, and dispatch process with integration to your Sage 300 CRE or Sage 100 Contractor, and TimberScan® systems. This solution can be configured to fit most business processes with its unique configuration tables.

1. Beginning with the **creation** of a work ticket, CCS users can dispatch orders to the field while automatically updating inventory, payroll, equipment, and purchasing records. With customizable and predefined form types, work orders can be setup with dynamic information tabs that only capture necessary information for added control.

2. CCS Service Work Order then **submits** the billing documents based on user-defined billing tables. TimberScan integration allows seamless approval workflows from CCS. In addition, the invoice transaction can be automatically sent to Sage 300 CRE or Sage 100 Contractor's Accounts Receivable module for recording and collection.

3. Customizable **reporting** in CCS Service Work Order allows users to apply company branding to invoices and other documents for simple, refined presentation.
